## NITROSATED AND NITROSYLATED CYCLOOXYGENASE-2 INHIBITORS, COMPOSITIONS AND METHODS OF USE

### RELATED APPLICATIONS

This application claims priority to U.S. Provisional Application No.

### FIELD OF THE INVENTION

The present invention describes novel nitrosated and/or nitrosylated cyclooxygenase 2 (COX-2) inhibitors and novel compositions comprising at least one nitrosated and/or nitrosylated cyclooxygenase 2 (COX-2) inhibitor, and, 10 optionally, at least one compound that donates, transfers or releases nitric oxide, stimulates endogenous synthesis of nitric oxide, elevates endogenous levels of endothelium-derived relaxing factor or is a substrate for nitric oxide synthase, and/or at least one therapeutic agent. The present invention also provides novel 15 compositions comprising at least one COX-2 inhibitor. The present invention also provides methods for treating inflammation, pain and fever; for treating and/or improving the gastrointestinal properties of COX-2 inhibitors; for facilitating wound healing; for treating and/or preventing renal toxicity; and for treating and/or preventing other disorders resulting from elevated levels of 20 cyclooxygenase-2.

### BACKGROUND OF THE INVENTION

Nonsteroidal anti-inflammatory compounds (NSAIDs) are widely used for the treatment of pain, inflammation, and acute and chronic inflammatory disorders such as osteoarthritis and rheumatoid arthritis. These compounds inhibit the 25 activity of the enzyme cyclooxygenase (COX), also known as prostaglandin G/H synthase, which is the enzyme that converts arachidonic acid into prostanoids. The NSAIDs also inhibit the production of other prostaglandins, especially prostaglandin G<sub>2</sub>, prostaglandin H<sub>2</sub> and prostaglandin E<sub>2</sub>, thereby reducing the prostaglandin-induced pain and swelling associated with the inflammation. 30 process. The chronic use of NSAIDs has been associated with adverse effects, such as gastrointestinal ulceration and renal toxicity. The undesirable side effects are also due to the inhibition of prostaglandin in the affected organ.

Recently two isoforms of cyclooxygenase, encoded by two distinct genes (Kujubu et al, *J. Biol. Chem.*, 266, 12866-12872 (1991)), have been identified – a

constitutive form, cyclooxygenase-1 (COX-1), and an inductive form, cyclooxygenase-2 (COX-2). It is thought that the antiinflammatory effects of NSAIDs are mediated by the inhibition of COX-2, whereas the side effects seem to be caused by the inhibition of COX-1. The NSAIDs currently on the market either inhibit both isoforms of COX with little selectivity for either isoform or are COX-1 selective. Recently compounds that are selective COX-2 inhibitors have been developed and marketed. These selective COX-2 inhibitors have the desired therapeutic profile of an antiinflammatory drug without the adverse effects commonly associated with the inhibition of COX-1. However, these compounds can result in dyspepsia and can cause gastropathy (Mohammed et al, *N. Engl. J. Med.*, 340(25) 2005 (1999)).

There is still a need in the art for COX-2 inhibitor compounds that have  
gastroprotective properties, facilitate wound healing, decreased renal toxicity and  
dyspepsia, and that can be used at low dosages. The present invention is directed  
to these, as well as other, important ends.

## 25 SUMMARY OF THE INVENTION

The present invention provides novel nitrosated and/or nitrosylated COX-2  
inhibitors, which are COX-2 inhibitors linked to at least one nitrogen monoxide  
group (NO), and/or at least one nitrogen dioxide group (NO<sub>2</sub>) (i.e., nitrosylated  
and/or nitrosated group, respectively). The resulting compounds are potent  
analgesics, have antiinflammatory properties and have an unexpected potential for  
facilitating wound healing. The novel compounds also have unexpected properties  
in the treatment and/or prevention of renal toxicity. The COX-2 inhibitors can be  
nitrosated and/or nitrosylated through one or more sites, such as oxygen

(hydroxyl condensation), sulfur (sulfhydryl condensation) and/or nitrogen. The COX-2 inhibitor can be, for example, a sulfonamide containing 1,5-diarylpyrazole derivative, such as, for example, CELEBREX® (4-(5-(4-methylphenyl)-3-(trifluoromethyl)-1H-pyrazol-1-yl)benzenesulfonamide, Celecoxib). The COX-2 inhibitor can also be, for example, a methylsulfonylphenyl-furanone derivative, such as, for example, Rofecoxib (VIOXX®, 4-(4'-methylsulfonylphenyl)-3-phenyl-2-(5H)-furanone). The present invention also provides compositions comprising such compounds in a pharmaceutically acceptable carrier.

The present invention is also based on the discovery that administering at least one nitrosated and/or nitrosylated COX-2 inhibitor and at least one nitric oxide donor reduces the gastrointestinal distress induced by COX-2 inhibitors. A nitric oxide donor is a compound that contains a nitric oxide moiety and which releases or chemically transfers nitric oxide to another molecule. Nitric oxide donors include, for example, S-nitrosothiols, nitrites, nitrates, N-oxo-N-nitrosamines, and substrates of the various isozymes of nitric oxide synthase. Thus, another aspect of the invention provides compositions comprising at least one COX-2 inhibitor that is substituted with at least one NO and/or NO<sub>2</sub> group (i.e., nitrosylated and/or nitrosated), and at least one compound that donates, transfers or releases nitric oxide as a charged species, i.e., nitrosonium (NO<sup>+</sup>) or nitroxyl (NO<sup>-</sup>), or as the neutral species, nitric oxide (NO<sup>•</sup>), and/or stimulates endogenous production of nitric oxide or EDRF *in vivo* and/or is a substrate for nitric oxide synthase.

Yet another aspect of the invention provides compositions comprising at least one COX-2 inhibitor that is substituted with at least one NO and/or NO<sub>2</sub> group (i.e., nitrosylated and/or nitrosated), and, optionally, at least one compound that donates, transfers or releases nitric oxide as a charged species, i.e., nitrosonium (NO<sup>+</sup>) or nitroxyl (NO<sup>-</sup>), or as the neutral species, nitric oxide (NO<sup>•</sup>), and/or stimulates endogenous production of nitric oxide or EDRF *in vivo* and/or is a substrate for nitric oxide synthase, and, optionally, at least one therapeutic agent, including but not limited to, steroids, nonsteroidal antiinflammatory compounds (NSAID), 5-lipoxygenase (5-LO) inhibitors, leukotriene B<sub>4</sub> (LTB<sub>4</sub>) receptor antagonists, leukotriene A<sub>4</sub> (LTA<sub>4</sub>) hydrolase inhibitors, 5-HT agonists, HMG CoA inhibitors, H<sub>2</sub> antagonists, antineoplastic agents, antiplatelet agents, decongestants,

diuretics, sedating or non-sedating anti-histamines, inducible nitric oxide synthase inhibitors, opioids, analgesics, *Helicobacter pylori* inhibitors, proton pump inhibitors, isoprostane inhibitors, and the like.

Another aspect of the invention provides compositions comprising at least one parent COX-2 inhibitor and at least one compound that donates, transfers or releases nitric oxide as a charged species, i.e., nitrosonium ( $\text{NO}^+$ ) or nitroxyl ( $\text{NO}^-$ ), or as the neutral species, nitric oxide ( $\text{NO}\bullet$ ), and/or stimulates endogenous production of nitric oxide or EDRF *in vivo* and/or is a substrate for nitric oxide synthase, and, optionally, at least one therapeutic agent, including but not limited to, steroids, nonsteroidal antiinflammatory compounds (NSAID), 5-lipoxygenase (5-LO) inhibitors, leukotriene B<sub>4</sub> (LTB<sub>4</sub>) receptor antagonists, leukotriene A<sub>4</sub> (LTA<sub>4</sub>) hydrolase inhibitors, 5-HT agonists, HMG CoA inhibitors, H<sub>2</sub> antagonists, antineoplastic agents, antiplatelet agents, decongestants, diuretics, sedating or non-sedating anti-histamines, inducible nitric oxide synthase inhibitors, opioids, analgesics, *Helicobacter pylori* inhibitors, proton pump inhibitors, isoprostane inhibitors, and the like.

Yet another aspect of the present invention provides methods for treating and/or preventing inflammation, pain and fever; for treating and/or improving gastrointestinal properties of COX-2 inhibitors; for facilitating wound healing; for treating and/or preventing renal toxicity; and for treating and/or preventing COX-2 mediated disorders (i.e., disorders resulting from elevated levels of COX-2) in a patient in need thereof which comprises administering to the patient a therapeutically effective amount of at least one nitrosated and/or nitrosylated COX-2 inhibitor compound, and, optionally, at least one compound that donates, transfers or releases nitric oxide as a charged species, i.e., nitrosonium ( $\text{NO}^+$ ) or nitroxyl ( $\text{NO}^-$ ), or as the neutral species, nitric oxide ( $\text{NO}\bullet$ ), and/or stimulates endogenous production of nitric oxide or EDRF *in vivo* and/or is a substrate for nitric oxide synthase and/or stimulates endogenous production of NO or EDRF *in vivo* and/or is a substrate for nitric oxide synthase (i.e., NO donors). The method can optionally further comprise the administration of at least one therapeutic agent, such as, for example, steroids, nonsteroidal antiinflammatory compounds (NSAID), 5-lipoxygenase (5-LO) inhibitors, leukotriene B<sub>4</sub> (LTB<sub>4</sub>) receptor antagonists,

leukotriene A<sub>4</sub> (LTA<sub>4</sub>) hydrolase inhibitors, 5-HT agonists, 3-hydroxy-3-methylglutaryl coenzyme A (HMG-CoA) inhibitors, H<sub>2</sub> antagonists, antineoplastic agents, antiplatelet agents, decongestants, diuretics, sedating or non-sedating anti-histamines, inducible nitric oxide synthase inhibitors, opioids, analgesics,

5      *Helicobacter pylori* inhibitors, proton pump inhibitors, isoprostane inhibitors, and mixtures thereof. In this aspect of the invention, the methods can involve administering nitrosated and/or nitrosylated COX-2 inhibitors, administering nitrosated and/or nitrosylated COX-2 inhibitors and NO donors, administering nitrosated and/or nitrosylated COX-2 inhibitors and therapeutic agents, or  
10     administering nitrosated and/or nitrosylated COX-2 inhibitors, NO donors and therapeutic agents. The nitrosated and/or nitrosylated COX-2 inhibitors, nitric oxide donors, and/or therapeutic agents can be administered separately or as components of the same composition in one or more pharmaceutically acceptable carriers.

15     Another aspect of the present invention provides methods for treating inflammation, pain and fever; for treating and/or improving the gastrointestinal properties of COX-2 inhibitors; for facilitating wound healing; for treating and/or preventing renal toxicity; and for treating and/or preventing other cyclooxygenase-2 mediated disorders comprising administration of at least one parent COX-2 inhibitor and at least one nitric oxide donor, and, optionally, at least one therapeutic agent.

20     Yet another aspect of the present invention provides kits comprising at least one nitrosated and/or nitrosylated COX-2 inhibitor, and, optionally, at least one compound that donates, transfers or releases nitric oxide as a charged species, i.e., nitrosonium (NO<sup>+</sup>) or nitroxyl (NO<sup>-</sup>), or as the neutral species, nitric oxide (NO<sup>•</sup>), and/or stimulates endogenous production of nitric oxide or EDRF *in vivo* and/or is a substrate for nitric oxide synthase. The kit can further comprise at least one therapeutic agent. The nitrosated and/or nitrosylated COX-2 inhibitor, the nitric oxide donor and/or therapeutic agent, can be separate components in the kit or can be in the form of a composition in one or more pharmaceutically acceptable carriers.

25     Yet another aspect of the present invention provides kits comprising at least one parent COX-2 inhibitor and at least one compound that donates, transfers or

releases nitric oxide as a charged species, i.e., nitrosonium ( $\text{NO}^+$ ) or nitroxyl ( $\text{NO}\cdot$ ), or as the neutral species, nitric oxide ( $\text{NO}\bullet$ ), and/or stimulates endogenous production of nitric oxide or EDRF *in vivo* and/or is a substrate for nitric oxide synthase. The kit can further comprise at least one therapeutic agent. The parent COX-2 inhibitor, the nitric oxide donor and/or therapeutic agent, can be separate components in the kit or can be in the form of a composition in one or more pharmaceutically acceptable carriers.

These and other aspects of the present invention are explained in detail herein.

#### BRIEF DESCRIPTION OF THE FIGURES

Fig. 1 shows the relaxation of rat aortic smooth muscle rings by (a) isosorbide dinitrate (ISDN, open triangles); (b) Example 1a (non-nitrosated compound, open circles); and (c) Example 1b (nitrosated compound, open squares). The non-nitrosated compound of Example 1a did not relax the tissue. At higher concentrations, the relaxation of the nitrosated compound of Example 1b was similar to that obtained with ISDN. Total number of samples tested varied from a minimum of 5 to a maximum of 12. In the x axis, log M corresponds to ten fold increases of the test compound from 100 nM ( $10^{-7}$ ) to 100  $\mu\text{M}$  ( $10^{-4}$ ). Results are expressed as the mean  $\pm$  standard error of the mean of the percentage of total relaxation induced by 10  $\mu\text{M}$  phenylephrine.

10 Compounds that donate, transfer or release nitric oxide species *in vivo* have been recognized as having a wide spectrum of advantages and applications. The present invention is based on the unexpected discovery of the effects of such compounds alone and together with one or more COX-2 inhibitors directly or indirectly linked with one or more nitric oxide moieties. Treatment or prevention of inflammation, pain and fever; treatment and/or improvement of the 15 gastrointestinal properties of COX-2 inhibitors; facilitation of wound healing; and treatment and/or prevention of renal toxicity and cyclooxygenase-2 mediated disorders can be obtained by the use of the nitrosated and/or nitrosylated COX-2 inhibitors of the present invention; or by the use of the nitrosated and/or nitrosylated COX-2 inhibitors in conjunction with one or more compounds that 20 donate, release or transfer nitric oxide and/or stimulate endogenous production of NO and/or EDRF *in vivo* and/or is a substrate for nitric oxide synthase, and, optionally, with one or more therapeutic agents.

In cases where R<sub>e</sub> and R<sub>f</sub> are a heterocyclic ring or R<sub>e</sub> and R<sub>f</sub> taken together with the carbon atoms to which they are attached are a heterocyclic ring, then R<sub>i</sub> can be a substituent on any disubstituted nitrogen contained within the radical where R<sub>i</sub> is as defined herein.

In cases where multiple designations of variables which reside in sequence are chosen as a "covalent bond" or the integer chosen is 0, the intent is to denote a

single covalent bond connecting one radical to another. For example,  $E_0$  would denote a covalent bond, while  $E_2$  denotes  $(E-E)$  and  $(C(R_e)(R_i))_2$  denotes  $-C(R_e)(R_i)-C(R_e)(R_i)-$ .

5 Another aspect of the present invention provides processes for making the novel compounds of the invention and to the intermediates useful in such processes. The reactions are performed in solvents appropriate to the reagents and materials used are suitable for the transformations being effected. It is understood by one skilled in the art of organic synthesis that the functionality present in the  
10 molecule must be consistent with the chemical transformation proposed. This will, on occasion, necessitate judgment by the routineer as to the order of synthetic steps, protecting groups required, and deprotection conditions. Substituents on the starting materials may be incompatible with some of the reaction conditions required in some of the methods described, but alternative methods and  
15 substituents compatible with the reaction conditions will be readily apparent to one skilled in the art. The use of sulfur and oxygen protecting groups is well known for protecting thiol and alcohol groups against undesirable reactions during a synthetic procedure and many such protecting groups are known and described by, for example, Greene and Wuts, *Protective Groups in Organic Synthesis*, Third  
20 Edition, John Wiley & Sons, New York (1999).

The chemical reactions described herein are generally disclosed in terms of their broadest application to the preparation of the compounds of this invention. Occasionally, the reactions may not be applicable as described to each compound included within the disclosed scope. The compounds for which this occurs will be  
25 readily recognized by one skilled in the art. In all such cases, either the reactions can be successfully performed by conventional modifications known to one skilled in the art, e.g., by appropriate protection of interfering groups, by changing to alternative conventional reagents, by routine modification of reaction conditions, and the like, or other reactions disclosed herein or otherwise conventional, will be  
30 applicable to the preparation of the corresponding compounds of this invention. In all preparative methods, all starting materials are known or readily prepared from known starting materials.

The parent COX-2 inhibitor compounds can then be nitrosated and/or nitrosylated through one or more sites such as oxygen, sulfur and/or nitrogen using the methods described in the examples herein and using conventional methods known to one skilled in the art.

15 For example, known methods for nitrosating and nitrosylating compounds are described in U.S. Patent Nos. 5,380,758 and 5,703,073; WO 97/27749; WO 98/19672; and Oae et al, *Org. Prep. Proc. Int.*, 15(3):165-198 (1983), the disclosures of each of which are incorporated by reference herein in their entirety. The methods of nitrosating and/or nitrosylating the compounds described in the examples herein 20 and in these references can be applied by one skilled in the art to produce any of the nitrosated and/or nitrosylated COX-2 inhibitors described herein.

The compounds of the present invention include the parent COX-2 inhibitors, including those described herein, which have been nitrosated and/or nitrosylated through one or more sites such as oxygen (hydroxyl condensation), 25 sulfur (sulphydryl condensation) and/or nitrogen. The nitrosated and/or nitrosylated COX-2 inhibitors of the present invention donate, transfer or release a biologically active form of nitrogen monoxide (i.e., nitric oxide).

Nitrogen monoxide can exist in three forms: NO<sup>-</sup> (nitroxyl), NO<sup>•</sup> (uncharged nitric oxide) and NO<sup>+</sup> (nitrosonium). NO<sup>•</sup> is a highly reactive short-lived species that is potentially toxic to cells. This is critical because the pharmacological efficacy of NO depends upon the form in which it is delivered. In contrast to the nitric oxide radical (NO<sup>•</sup>), nitrosonium (NO<sup>+</sup>) does not react with O<sub>2</sub> or O<sub>2</sub><sup>-</sup> species, and functionalities capable of transferring and/or releasing NO<sup>+</sup> and 30

NO<sup>-</sup> are also resistant to decomposition in the presence of many redox metals. Consequently, administration of charged NO equivalents (positive and/or negative) is a more effective means of delivering a biologically active NO to the desired site of action.

5 Compounds contemplated for use in the present invention (e.g., nitrosated and/or nitrosylated COX-2 inhibitors) are, optionally, used in combination with nitric oxide and compounds that release nitric oxide or otherwise directly or indirectly deliver or transfer a biologically active form of nitrogen monoxide to a site of its intended activity, such as on a cell membrane *in vivo*.

10 The term "nitric oxide" encompasses uncharged nitric oxide (NO<sup>•</sup>) and charged nitrogen monoxide species, preferably charged nitrogen monoxide species, such as nitrosonium ion (NO<sup>+</sup>) and nitroxyl ion (NO<sup>-</sup>). The reactive form of nitric oxide can be provided by gaseous nitric oxide. The nitrogen monoxide releasing, delivering or transferring compounds have the structure F-NO, wherein F is a  
15 nitrogen monoxide releasing, delivering or transferring moiety, and include any and all such compounds which provide nitrogen monoxide to its intended site of action in a form active for its intended purpose. The term "NO adducts" encompasses any nitrogen monoxide releasing, delivering or transferring compounds, including, for example, S-nitrosothiols, nitrites, nitrates, S-nitrothiols,  
20 sydnonimines, 2-hydroxy-2-nitrosohydrazines, (NONOates), (E)-alkyl-2-[*(E*)-hydroxyimino]-5-nitro-3-hexene amines or amides, nitrosoamines, furoxans as well as substrates for the endogenous enzymes which synthesize nitric oxide. The "NO adducts" can be mono-nitrosylated, poly-nitrosylated, mono-nitrosated and/or poly-nitrosated at a variety of naturally susceptible or artificially provided binding  
25 sites for biologically active forms of nitrogen monoxide.

One group of NO adducts is the S-nitrosothiols, which are compounds that include at least one -S-NO group. These compounds include S-nitroso-polypeptides (the term "polypeptide" includes proteins and polyamino acids that do not possess an ascertained biological function, and derivatives thereof); S-  
30 nitrosylated amino acids (including natural and synthetic amino acids and their stereoisomers and racemic mixtures and derivatives thereof); S-nitrosylated sugars; S-nitrosylated, modified and unmodified, oligonucleotides (preferably of at least 5, and more preferably 5-200 nucleotides); straight or branched, saturated or

Nitrosothiols can be prepared by various methods of synthesis. In general, the thiol precursor is prepared first, then converted to the S-nitrosothiol derivative by nitrosation of the thiol group with NaNO<sub>2</sub> under acidic conditions (pH is about 2.5) which yields the S-nitroso derivative. Acids which can be used for this purpose include aqueous sulfuric, acetic and hydrochloric acids. The thiol precursor can also be nitrosylated by reaction with an organic nitrite such as tert-butyl nitrite, or a nitrosonium salt such as nitrosonium tetrafluoroborate in an inert solvent.

The compounds that include at least one ON-O-, ON-N- or ON-C- group are preferably ON-O-, ON-N- or ON-C-polypeptides (the term "polypeptide" includes proteins

Compounds which form disulfide species release nitroxyl ion (NO<sup>-</sup>) and uncharged nitric oxide (NO<sup>•</sup>). Compounds where the thiol groups are not sufficiently close to form disulfide bridges generally provide nitric oxide as the NO<sup>-</sup> form and not as the uncharged NO<sup>•</sup> form.

Natl. Acad. Sci. USA*, 84:9265-9269 (1987)).

Parenteral includes subcutaneous injections, intravenous, intramuscular, intrasternal injection, or infusion techniques.

Transdermal compound administration, which is known to one skilled in the art, involves the delivery of pharmaceutical compounds via percutaneous passage of the compound into the systemic circulation of the patient. Topical administration can also involve the use of transdermal administration such as transdermal patches or iontophoresis devices. Other components can be incorporated into the transdermal patches as well. For example, compositions and/or transdermal patches can be formulated with one or more preservatives or bacteriostatic agents including, but not limited to, methyl hydroxybenzoate, propyl hydroxybenzoate, chlorocresol, benzalkonium chloride, and the like. Dosage forms for topical administration of the compounds and compositions can include creams, sprays, lotions, gels, ointments, eye drops, nose drops, ear drops, and the like. In such dosage forms, the compositions of the invention can be mixed to form white, smooth, homogeneous, opaque cream or lotion with, for example, benzyl alcohol 1% or 2% (wt/wt) as a preservative, emulsifying wax, glycerin, isopropyl palmitate, lactic acid, purified water and sorbitol solution. In addition, the compositions can contain polyethylene glycol 400. They can be mixed to form ointments with, for example, benzyl alcohol 2% (wt/wt) as preservative, white petrolatum, emulsifying wax, and tenox II (butylated hydroxyanisole, propyl gallate, citric acid, propylene glycol). Woven pads or rolls of bandaging material, e.g., gauze, can be impregnated with the compositions in solution, lotion, cream, ointment or other such form can also be used for topical application. such solid dosage forms, the active compounds can be admixed with at least one inert diluent such as sucrose, lactose or starch. Such dosage forms can also comprise, as in normal practice, additional substances other than inert diluents, e.g., lubricating agents such as magnesium stearate. In the case of capsules, tablets, effervescent tablets, and pills, the dosage forms can also comprise buffering agents. Soft gelatin capsules can be prepared to contain a mixture of the active compounds or compositions of the present invention and vegetable oil. Hard gelatin capsules can contain granules of the active compound in combination with a solid, pulverulent carrier such as lactose, saccharose, sorbitol, mannitol, potato starch, corn starch, amylopectin, cellulose derivatives of gelatin. Suppositories for vaginal or rectal administration of the compounds and compositions of the invention, such as for treating pediatric fever and the like, can be prepared by mixing the compounds or compositions with a suitable nonirritating excipient such as cocoa butter and polyethylene glycols which are solid at room temperature but liquid at rectal temperature, such that they will melt in the rectum and release the drug.

Injectable preparations, for example, sterile injectable aqueous or oleaginous suspensions can be formulated according to the known art using suitable dispersing agents, wetting agents and/or suspending agents. The sterile injectable preparation can also be a sterile injectable solution or suspension in a nontoxic parenterally acceptable diluent or solvent, for example, as a solution in 1,3-butanediol. Among the acceptable vehicles and solvents that can be used are water, Ringer's solution, and isotonic sodium chloride solution. Sterile fixed oils are also conventionally used as a solvent or suspending medium.

The compositions of this invention can further include conventional excipients, i.e., pharmaceutically acceptable organic or inorganic carrier substances suitable for parenteral application which do not deleteriously react with the active

compounds. Suitable pharmaceutically acceptable carriers include, for example, water, salt solutions, alcohol, vegetable oils, polyethylene glycols, gelatin, lactose, amylose, magnesium stearate, talc, surfactants, silicic acid, viscous paraffin, perfume oil, fatty acid monoglycerides and diglycerides, petroethral fatty acid esters, hydroxymethyl-cellulose, polyvinylpyrrolidone, and the like. The pharmaceutical preparations can be sterilized and if desired, mixed with auxiliary agents, e.g., lubricants, preservatives, stabilizers, wetting agents, emulsifiers, salts for influencing osmotic pressure, buffers, colorings, flavoring and/or aromatic substances and the like which do not deleteriously react with the active 5 compounds. For parenteral application, particularly suitable vehicles consist of solutions, preferably oily or aqueous solutions, as well as suspensions, emulsions, or implants. Aqueous suspensions may contain substances which increase the viscosity of the suspension and include, for example, sodium carboxymethyl cellulose, sorbitol and/or dextran. Optionally, the suspension may also contain 10 stabilizers.

The composition, if desired, can also contain minor amounts of wetting agents, emulsifying agents and/or pH buffering agents. Oral formulations can 20 include standard carriers such as pharmaceutical grades of mannitol, lactose, starch, magnesium stearate, sodium saccharine, cellulose, magnesium carbonate, and the like.

Various delivery systems are known and can be used to administer the 25 compounds or compositions of the present invention, including, for example, encapsulation in liposomes, microbubbles, emulsions, microparticles, microcapsules and the like. The required dosage can be administered as a single unit or in a sustained release form.

The bioavailability of the compositions can be enhanced by micronization of 30 the formulations using conventional techniques such as grinding, milling, spray drying and the like in the presence of suitable excipients or agents such as phospholipids or surfactants.

The preferred methods of administration of the nitrosated and/or

nitrosylated COX-2 inhibitor compositions or the parent COX-2 inhibitor for the treatment of gastrointestinal disorders are orally, bucally or by inhalation. The preferred methods of administration for the treatment of inflammation and microbial infections are orally, bucally, topically, transdermally or by inhalation.

30      While individual needs may vary, determination of optimal ranges for effective amounts of the compounds and/or compositions is within the skill of the art. Generally, the dosage required to provide an effective amount of the compounds and compositions, which can be adjusted by one of ordinary skill in the art, will vary depending on the age, health, physical condition, sex, diet, weight,

extent of the dysfunction of the recipient, frequency of treatment and the nature and scope of the dysfunction or disease, medical condition of the patient, the route of administration, pharmacological considerations such as the activity, efficacy, pharmacokinetic and toxicology profiles of the particular compound used, whether a drug delivery system is used, and whether the compound is administered as part of a drug combination.

The amount of a given nitrosated and/or nitrosylated COX-2 inhibitor or the parent COX-2 inhibitor which will be effective in the treatment of a particular disorder or condition will depend on the nature of the disorder or condition, and can be determined by standard clinical techniques, including reference to Goodman and Gilman, *supra*; The Physician's Desk Reference, Medical Economics Company, Inc., Oradell, N.J., 1995; and Drug Facts and Comparisons, Inc., St. Louis, MO, 1993. The precise dose to be used in the formulation will also depend on the route of administration, and the seriousness of the disease or disorder, and should be decided by the physician and the patient's circumstances.

The amount of nitric oxide donor in a pharmaceutical composition can be in amounts of about 0.1 to about 10 times the molar equivalent of the COX-2 inhibitor. The usual daily doses of nitrosated and/or nitrosylated COX-2 inhibitors are about 0.001 mg to about 140 mg/kg of body weight per day, preferably 0.005 mg to 30 mg/kg per day, or alternatively about 0.5 mg to about 7 g per patient per day. For example, inflammations may be effectively treated by the administration of from about 0.01 mg to 50 mg of the compound per kilogram of body weight per day, or alternatively about 0.5 mg to about 3.5 g per patient per day. The compounds may be administered on a regimen of up to 6 times per day, preferably 1 to 4 times per day, and most preferably once per day. Effective doses may be extrapolated from dose-response curves derived from *in vitro* or animal model test systems and are in the same ranges or less than as described for the commercially available compounds in the Physician's Desk Reference, *supra*.

The present invention also provides pharmaceutical kits comprising one or more containers filled with one or more of the ingredients of the pharmaceutical compounds and/or compositions of the present invention, including, at least, one or more of the COX-2 inhibitors optionally substituted with at least one NO and/or NO<sub>2</sub> group, described herein and one or more of the NO donors described herein.

4a. 2-{1-[(4-Chlorophenyl)methyl]-5-methoxy-2-methylindol-3-yl}ethan-1-ol

A solution of indomethacin (10 g, 28 mmol) in THF (90 mL) was immersed in an ice bath to maintain an internal temperature of 10–15 °C. To this solution was added BF<sub>3</sub>-Et<sub>2</sub>O (30 mL, 230 mmol) over 5 min, resulting in the formation of a precipitate. Sodium borohydride (4.2 g, 110 mmol) was added portionwise over 10 min resulting in vigorous effervescence. After gas evolution subsided the flask was stoppered and allowed to warm to room temperature. After 1 hour the pressure was vented through a needle. The heterogeneous mixture was stirred for 6 hours.

20 The mixture was cooled in an ice bath and was quenched by adding saturated NaHCO<sub>3</sub>. To break the resultant emulsion the mixture was made acidic with 1N HCl and extracted with a 3:1 mixture of Et<sub>2</sub>O:Hexane (270 mL). The organic layer was washed with brine, dried over Na<sub>2</sub>SO<sub>4</sub>, and evaporated. The residue was taken up in a 3:1 mixture of hot Hex:EtOAc (80 mL). Upon cooling to room temperature, 25 crystals began to form. Crystallization was completed by cooling to -20 °C. **Example 21: Assay for Ovine COX-1 and COX-2 activity**

The ovine COX-1 and COX-2 activities and the measurement of the prostaglandin products synthesized were performed using the COX Inhibitor Screening Assay (Cayman Chemical, Ann Arbor, MI, which also contained the Prostaglandin Screening EIA Kit, used for prostaglandin quantification). The test compounds were dissolved at 50 times the highest final reaction concentration in DMSO or any other suitable solvent as stock solutions. These stock solutions were then diluted in the same solvent. Eight glass test tubes (13 x 100 mm) were placed

in a 37 °C water bath. To each test tube was added 950 µL of reaction buffer (0.1 M Tris-HCl, pH 8.0, containing 5 mM EDTA, and 2 mM phenol), 10 µL of 100 M heme solution, and 10 µL (5 units) of either ovine COX-1 or COX-2 and the resulting mixture was incubated with the enzyme for 2 minutes. Twenty µL of the solvent  
5 was added to one tube (100% initial activity or solvent control) and 20 µL of each dilution of the test compound was added to one tube each. Each tube was vortexed immediately after the addition. The enzyme was incubated with the inhibitor for 3.5 minutes at 37 °C. The enzymatic reaction was then initiated by the addition of 10 µL of freshly prepared 10 mM arachidonic acid (neutralized with KOH),  
10 vortexed and then incubated for 2 minutes at 37 °C. The reaction was terminated by the addition of 50 µL of 1 M HCl, vortexed and placed at room temperature. One hundred microliters of a saturated stannous chloride solution (50 mg/mL of 0.1 M HCl) was added and the reaction mixture was allowed to stand at room temperature for at least 5 minutes.

15 The prostaglandins (PG) produced in the reactions were assayed, after a 2,000- fold dilution, using the Prostaglandin Screening EIA Kit (Cayman Chemical, Ann Arbor, MI). The assay contains an antibody with broad specificity for all the prostaglandin families (PGF, PGE, PGD, and thromboxane B-type) synthesized in the COX-1/COX 2 reactions. The synthesized prostaglandin competes with a PG-  
20 tagged acetylcholine esterase tracer for binding to the PG antibody. Binding of synthesized PG lowers the colorimetric development of the Ellman's Reagent (computed as %B/B<sub>0</sub>). The actual amount of synthesized PG was interpolated from a standard curve using known amounts of supplied prostaglandin E2 (PGE<sub>2</sub>) (PGE<sub>2</sub> concentration vs. %B/B<sub>0</sub>). The data generated were the mean ± standard deviation of triplicate wells in the EIA for a single reaction at a given inhibitor concentration.  
25 A plot of % of control (i.e., the solvent control without inhibitor) vs. test compound inhibitor concentration for both isoenzymes was used to determine the IC<sub>50</sub> 's for COX-1 and COX-2 for that test compound. The IC<sub>50</sub> for the compounds are given in Table 1.

TABLE 1

Test Compound	IC <sub>50</sub> VALUES FOR COX-1 and COX-2	
	COX-1 IC <sub>50</sub> (μM)	COX-2 IC <sub>50</sub> (μM)
Indomethacin	0.18	0.35
Celecoxib	34	0.34
Example 1a	100	3.3
Example 1b	190	10
Example 2a	No inhibition up to 300	24
Example 2b	No inhibition up to 300	1.2
Example 3e	62	0.006
Example 3g	No inhibition up to 300	70
Example 5a	No inhibition up to 300	12
Example 5b	No inhibition up to 300	33

The NSAID, indomethacin, did not show selectivity for either COX-1 or COX-2. Celecoxib, a selective COX-2 inhibitor, used as a control, was selective for COX-2. The results show that the nitrosated compounds (i.e., Examples 1b, 2b and 5b) have similar COX-2 selectivity as their parent non-nitrosated compound (i.e., Example 1a, 2a and 5a respectively). Hence, nitrosation did not effect the COX-2 inhibition properties. The results show that the nitrosylated compound (i.e., Example 3g) was not as potent as the parent non-nitrosylated compound (i.e., Example 3e). The nitrosylation of the sulfonamide group on the parent COX-2 inhibitor probably effected the COX-2 inhibition properties of the nitrosylated compound.

**Example 22: Assay for Human COX-1 and COX-2 activity**

The human COX-1 and COX-2 activities and the measurement of the prostaglandin products synthesized were performed using the COX Inhibitor Screening Assay (Cayman Chemical, Ann Arbor, MI, which also contained the Prostaglandin Screening EIA Kit, used for prostaglandin quantification). The test compounds were dissolved at 50 times the highest final reaction concentration in DMSO or any other suitable solvent as stock solutions. These stock solutions were then diluted in the same solvent. Eight glass test tubes (13 x 100 mm) were placed

in a 25 °C water bath. To each test tube was added 950 µL of reaction buffer (0.1 M Tris-HCl, pH 8.0, containing 5 mM EDTA, and 2 mM phenol), 10 µL of 100 M heme solution, and 10 µL (5 units) of either human COX-1 or COX-2 and the resulting mixture incubated with the enzyme for 2 minutes. Twenty µL of the solvent was  
5 added to one tube (100% initial activity or solvent control) and 20 µL of each dilution of the test compound was added to one tube each. Each tube was vortexed immediately after the addition. The enzyme was incubated with the inhibitor for 20 minutes at 25 °C. The enzymatic reaction was then initiated by the addition of 10 µL of freshly prepared 10 mM arachidonic acid (neutralized with KOH), vortexed  
10 and then incubated for 2 minutes (or, in some cases as indicated, 30 seconds) at 37 °C. The reaction was terminated by the addition of 50 µL of 1 M HCl, vortexed and placed at room temperature. One hundred microliters of a saturated stannous chloride solution (50 mg/mL of 0.1 M HCl) was added and the reaction mixture was allowed to stand at room temperature for at least 5 min.

15 The prostaglandins (PG) produced in the reactions were assayed, after a 2,000- fold dilution, using the Prostaglandin Screening EIA Kit (Cayman Chemical, Ann Arbor, MI). The assay contains an antibody with broad specificity for all the prostaglandin families (PGF, PGE, PGD, and thromboxane B-type) synthesized in the COX-1/COX 2 reactions. The synthesized prostaglandin competes with a PG-  
20 tagged acetylcholine esterase tracer for binding to the PG antibody. Binding of synthesized PG lowers the colorimetric development of the Ellman's Reagent (computed as %B/B<sub>0</sub>). The actual amount of synthesized PG was interpolated from a standard curve using known amounts of supplied prostaglandin E2 (PGE<sub>2</sub>) (PGE<sub>2</sub> concentration vs. %B/B<sub>0</sub>). The data generated were the mean ± standard deviation of triplicate wells in the EIA for a single reaction at a given inhibitor concentration.  
25 A plot of % of control (i.e., the solvent control without inhibitor) vs. test compound inhibitor concentration for both isoenzymes was used to determine the IC<sub>50</sub>'s for COX-1 and COX-2 for that test compound, when IC<sub>50</sub>'s were calculated. The % inhibition for selected concentrations of inhibitors tested are given in Table 2.

TABLE 2

Test Compound	% INHIBITION OF HUMAN COX-1 AND COX-2	
	COX-1 Inhibition (% at 100 µM)	COX-2 Inhibition (% at 10 µM)
Example 2a	0 <sup>a</sup>	65
Example 2b	0 <sup>a</sup>	100
Example 4a	89 <sup>b</sup>	69 <sup>b</sup>
Example 4b	49 <sup>b</sup>	91 <sup>b</sup>
Example 19d	95	100
Example 19e	0	100
Example 20d	16	34
Example 20e	0	37

a = Ovine COX-1

b = 30 second incubation with arachidonic acid substrate

5        The results show that the nitrosated compounds (i.e., Examples 2b, 5b, 19e and 20e) have similar or slightly improved COX-2 selectivity compared to their parent non-nitrosated compound (i.e., Example 2a, 4a, 19d and 20d, respectively). Hence, nitrosation did not effect the COX-2 inhibition properties and might improve the COX-2 inhibition properties.

10      **Example 23: Preparation of rat aortic smooth muscle rings**

Male Sprague-Dawley rats (Charles River Laboratories (Wilmington, MA) were euthanized by intraperitoneal injection of a high dose of sodium pentobarbitone (80-100 mg/kg). The thoracic aorta was rapidly excised and immediately placed in a Petri dish containing warm (37 °C) oxygenated (95% O<sub>2</sub> and 5% CO<sub>2</sub>) Kreb's buffer (composition per millimolar: NaCl (119); KCl (4.69); CaCl<sub>2</sub>.H<sub>2</sub>O (2.52); MgSO<sub>4</sub>.7H<sub>2</sub>O (0.57); NaHCO<sub>3</sub> (25); NaH<sub>2</sub>PO<sub>4</sub>.H<sub>2</sub>O (1.01) and glucose (11.1). Under a stereoscopic dissecting microscope, the aorta was cleaned, freed from adhering fat and connective tissues. The tissue was cut into ring segments, each approximately 2-3 mm in length.

20      For experiments to measure relaxation of the tissue under various conditions, a stainless steel tissue holder and an U-shaped stainless steel wire were inserted into the lumen of the aortic ring. The tissue holder anchored the ring at

the bottom of the organ bath whereas the end of the U-shaped steel wire was tied with fine silk thread so that it connected to the FT-202 transducer. The tissue holder and the steel wire along with the aortic ring were then suspended in a 5-mL double-jacketed temperature-controlled glass organ bath (Radnoti Glass Technology, Inc., Monrovia, CA) filled with fresh Kreb's buffer. A mixture of 95% O<sub>2</sub> and 5% CO<sub>2</sub> was bubbled through a porous sintered disc at the bottom of the bath. The rings were given an initial resting tension of 1.5 g and the preparation was allowed to equilibrate at the initial tension for about 90 minutes. During this equilibration period, the bath fluid was changed every 15 minutes and replaced with fresh prewarmed (37 °C) Kreb's buffer. The isometric tension of the aortic muscle at rest and its response to different stimuli were recorded on a Power Macintosh 6100 computer via a MacLab 8/S computer interface (CB Sciences, Inc, Milford, MA) after an initial amplification through a low-noise ETH-400 bioamplifier (CB Sciences, Inc, Milford, MA). Contractile responsiveness of the tissue strips was established with 10 µM phenylephrine and the strips were incubated with the drug for 20 minutes to establish a steady level of contraction. To test the relaxation effects, test compounds were added to the phenylephrine-precontracted strips in the tissue bath at cumulative concentrations of 0.1 µM to 0.1 mM. Concentration of test compounds was increased only after relaxation at the previous concentration had reached a plateau level.

**Example 24: Relaxation of aortic smooth muscle ring by Example 1**

The tissue was prepared according to Example 23. The percent contraction of phenylephrine-contracted aortic smooth muscle rings induced by isosorbide dinitrate (ISDN), Example 1a and Example 1b (nitrate) was measured. Fig. 1 shows that the parent non-nitrosated compound, Example 1a, did not relax the aortic ring. The nitrosated compound, Example 1b, induced the relaxation of the aortic ring. The observed relaxation was more potent than that obtained by the nitrate compound, isosorbide dinitrate.

**Example 25: Relaxation of aortic smooth muscle ring by Example 2**

The tissue was prepared according to Example 23. The percent contraction of phenylephrine-contracted aortic smooth muscle rings induced by isosorbide dinitrate (ISDN), Example 2a and Example 2b (nitrate) was measured. Fig. 2 shows that the parent non-nitrosated compound, Example 2a, did not relax the

aortic ring. The nitrosated compound, Example 2b, induced the relaxation of the aortic ring. The observed relaxation was similar to that obtained by the nitrate compound, isosorbide dinitrate.

**Example 26: Relaxation of aortic smooth muscle ring by Example 3**

5       The tissue was prepared according to Example 23. The percent contraction of phenylephrine-contracted aortic smooth muscle rings induced by S-nitrosoglutathione (GSNO), Example 3e and Example 3h (nitrosothiol) was measured. Fig. 3 shows that the parent non-nitrosylated compound, Example 3e, did not relax the aortic ring. The nitrosylated compound, Example 3h, induced the 10 relaxation of the aortic ring. The observed relaxation was similar to that obtained by the nitrosothiol compound, S-nitrosoglutathione.

**Example 27: Relaxation of aortic smooth muscle ring by Example 20**

15       The tissue was prepared according to Example 23. The percent contraction of phenylephrine-contracted aortic smooth muscle rings induced by isosorbide dinitrate (ISDN), Example 20d and Example 20e (nitrate) was measured. Fig. 4 shows that the parent non-nitrosylated compound, Example 20d, did not relax the aortic ring. The nitrosated compound, Example 20e, induced the relaxation of the aortic ring. The observed relaxation was similar to that obtained by the nitrate compound, isosorbide dinitrate.

20       **Example 28: Anti-inflammatory paw edema test for Example 2**

25       The carrageenan-induced rat paw edema test was used to measure antiinflammatory activity. The paw edema test was performed according to the method of Winter et al, *Proc. Soc. Exp. Biol. Med.* 111: 544-547, 1962. Male Sprague-Dawley rats (200-250 g) were fasted for 24 hours with water *ad libitum*. The rats were dosed intragastrically with test compounds in a volume of 5 mL/kg. One hour after dosing the paw volume was measured. Then each rat received a subplantar injection of 50 µl of 1% suspension of carrageenan. Three hours later, the paw volume was measured and compared with the initial volume measured immediately after carrageenan injection. The increase in paw volume is presented 30 as the mean ± SEM for 5 rats per group. Data were analyzed by performing an ANOVA test followed by a Student-Keuls post hoc test.

Figure 5 shows that the parent non-nitrosated compound Example 2a, the nitrosated compound Example 2b and Celecoxib all reduced the paw volume and,

hence, these compounds have antiinflammatory activity. Thus, nitrosation did not effect the COX-2 inhibition properties of the compounds.

## INTERNATIONAL SEARCH REPORT

International application No. PCT/US00/35014
---

**Box I Observations where certain claims were found unsearchable (Continuation of Item 1 of first sheet)**

This international report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1.  Claim Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:
  
  
  
2.  Claim Nos.:  
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
  
  
  
3.  Claim Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

**Box II Observations where unity of invention is lacking (Continuation of Item 2 of first sheet)**

This International Searching Authority found multiple inventions in this international application, as follows:  
Please See Continuation Sheet

1.  As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2.  As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3.  As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.: 1-66 (in part) i.e., compounds of formula II and VII
  
  
  
4.  No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

The additional search fees were accompanied by the applicant's protest.

No protest accompanied the payment of additional search fees.

**BOX II. OBSERVATIONS WHERE UNITY OF INVENTION IS LACKING** This application contains the following inventions or groups of inventions which are not so linked as to form a single general inventive concept under PCT Rule 13.1. In order for all inventions to be examined, the appropriate additional examination fees must be paid.

Group I, claim(s) 1-66 (in part), drawn to compounds of formula VII, corresponding composition, method of use and kit.

Group II, claim(s) 1-66 (in part), drawn to compounds of formula I, corresponding composition, method of use and kit.

Group III, claim(s) 1-66 (in part), drawn to compounds of formula II, corresponding composition, method of use and kit.

Group IV, claim(s) 1-66 (in part), drawn to compounds of formula III, corresponding composition, method of use and kit.

Group V, claim(s) 1-66 (in part), drawn to compounds of formula IV, corresponding composition, method of use and kit.

Group VI, claim(s) 1-66 (in part), drawn to compounds of formula V, corresponding composition, method of use and kit.

Group VII, claim(s) 1-66 (in part), drawn to compounds of formula VI, corresponding composition, method of use and kit.

Group VIII, claim(s) 1-66 (in part), drawn to compounds of formula VIII, corresponding composition, method of use and kit.

Group IX, claim(s) 1-66 (in part), drawn to compounds of formula IX, corresponding composition, method of use and kit.

Group X, claim(s) 1-66 (in part), drawn to compounds of formula X, corresponding composition, method of use and kit.

Group XI, claim(s) 1-66 (in part), drawn to compounds of formula XI, corresponding composition, method of use and kit.

Group XII, claim(s) 1-66 (in part), drawn to compounds of formula XII, corresponding composition, method of use and kit.

Group XIII, claim(s) 1-66 (in part), drawn to compounds of formula XIII, corresponding composition, method of use and kit.

Group XIV, claim(s) 1-66 (in part), drawn to compounds of formula XIV, corresponding composition, method of use and kit.

Group XV, claim(s) 1-66 (in part), drawn to compounds of formula XV, corresponding composition, method of use and kit.

Group XVI, claim(s) 1-66 (in part), drawn to compounds of formula XVI, corresponding composition, method of use and kit.

Group XVII, claim(s) 67-70, drawn to a kit.

The inventions listed as Groups I-XVII do not relate to a single general inventive concept under PCT Rule 13.1 because, under PCT Rule 13.2, they lack the same or corresponding special technical features for the following reasons: The inventions listed as Groups I-XVII do not relate to a single inventive concept under PCT Rule 13.1 because, under PCT Rule 13.2, they lack the same or corresponding special technical features for the following reasons:

Groups I-XVI are drawn to structurally dissimilar compounds that lack a common core, which compounds are not art recognized equivalents of each other. There is no special technical feature that is common to all of the compounds as required by PCT Rule 13.2. Group XVII is drawn to a kit which is not coextensive with the compounds of Groups I-XVI, but in fact is of different scope and thus, can not be considered to be adapted with the compounds or sharing a common special technical feature.
